Overview

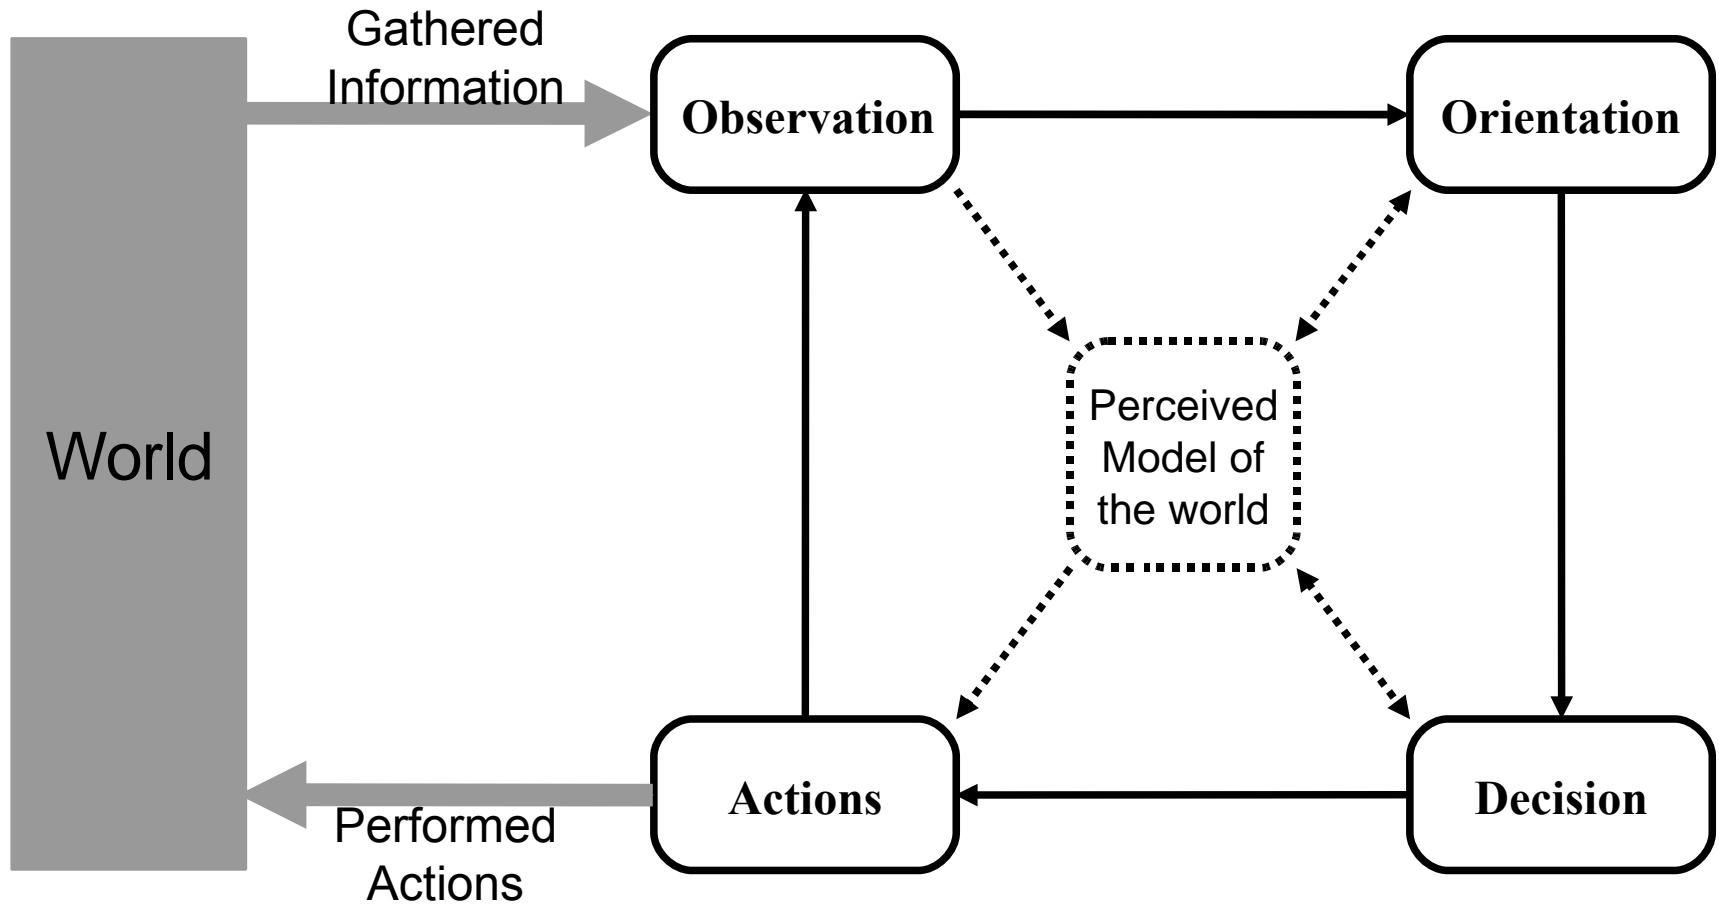

- Boyd's OODA loop model
- Expanded model of the Orientation step
- Information Warfare and Orientation
- Case studies of Deception and Self-deception

Boyd's OODA loop model

- Name originates from the loop's steps
 - Observation
 - Orientation
 - Decision
 - Action
- Describes the decision-making process of an individual or organisation
- Models a feedback loop between the decision-maker and their environment

Boyd's OODA loop model

Orientation step

Contains a method that combines

- New information
 - Previous experience
 - Cultural traditions
 - Genetic heritage
 - Analysis and synthesis methods
- to produce an updated model of the world.

Orientation step

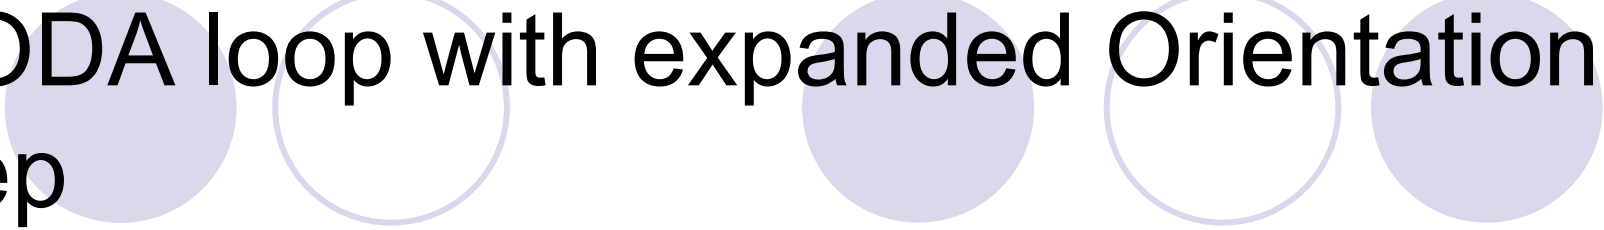

- However there is no description of how this process operates
- We now describe a model of the internal processes of the Orientation step

Proposed Orientation Step Actions

- Recognise known objects, events and relationships
- Analyse new information with known processing methods
- Evaluate the completion of aims and develop new aims
- Determine what actions may be performed how they will affect the world

OODA loop with expanded Orientation step

- Observation
- Orientation
 - Identification
 - Interpretation
 - Aims Derivation
 - Options Generation
- Decision
- Action

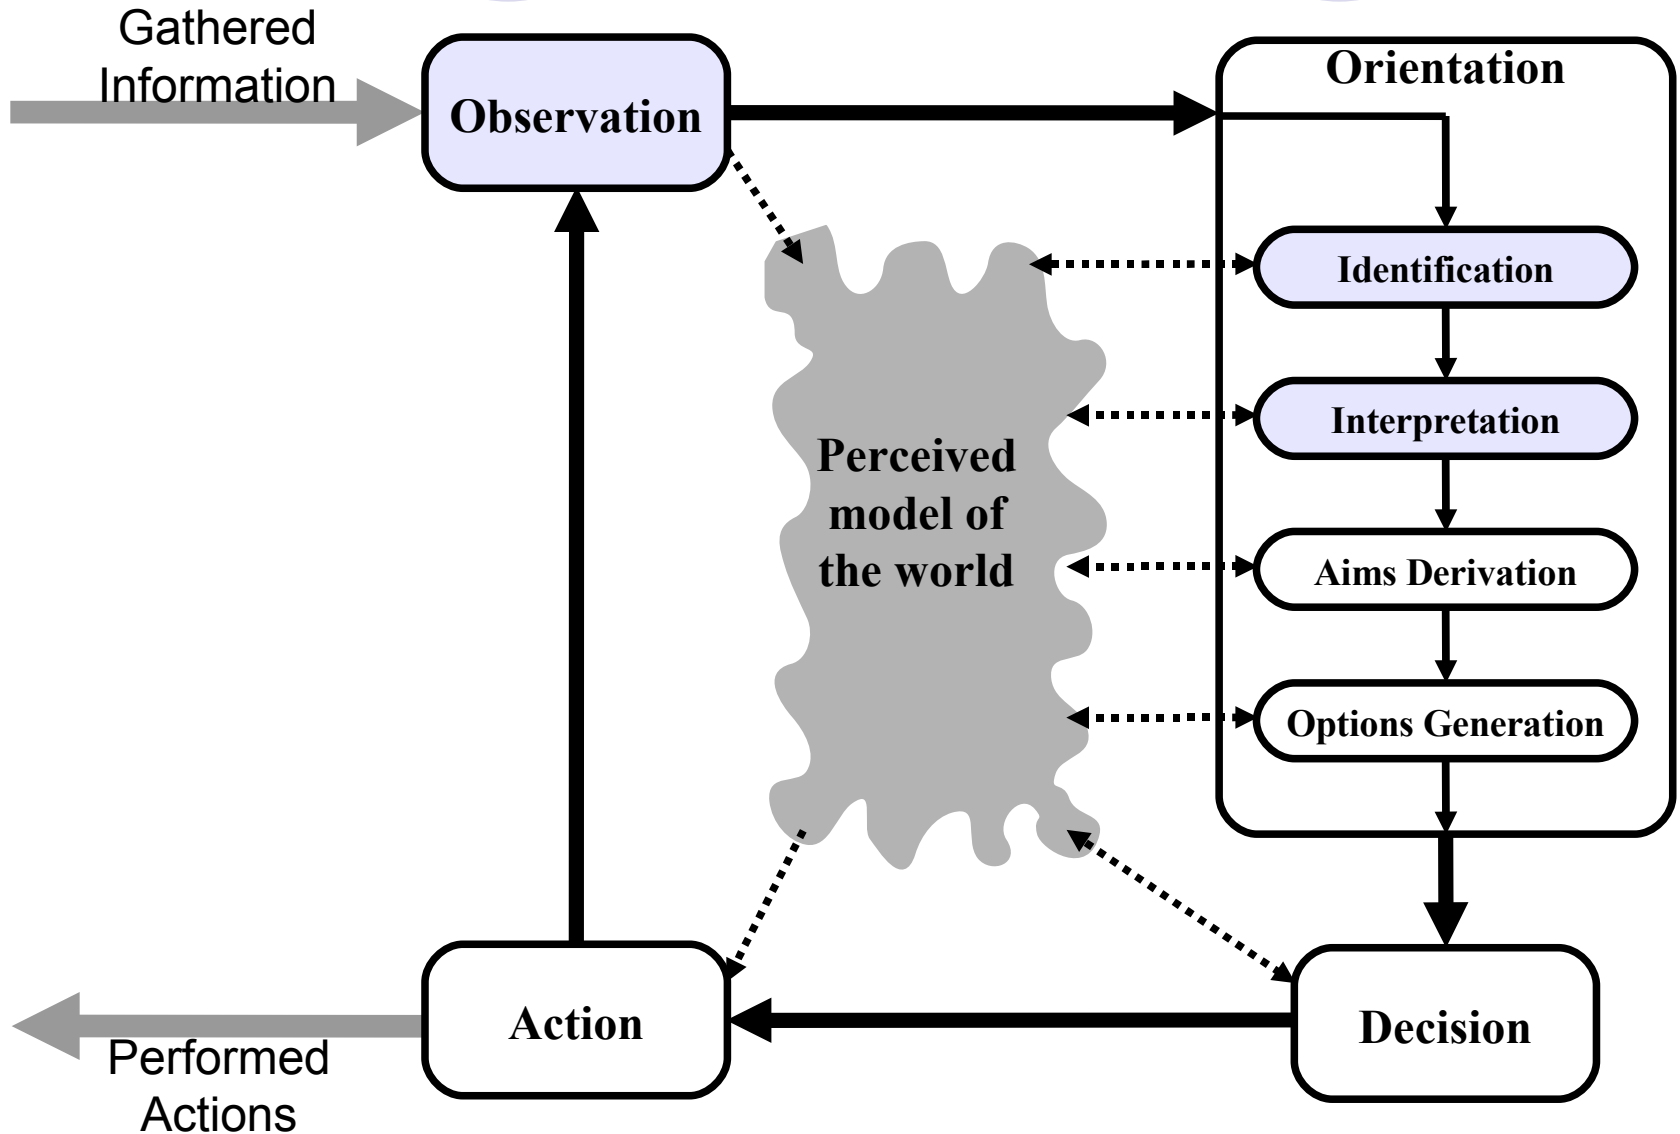

Expanded Orientation step

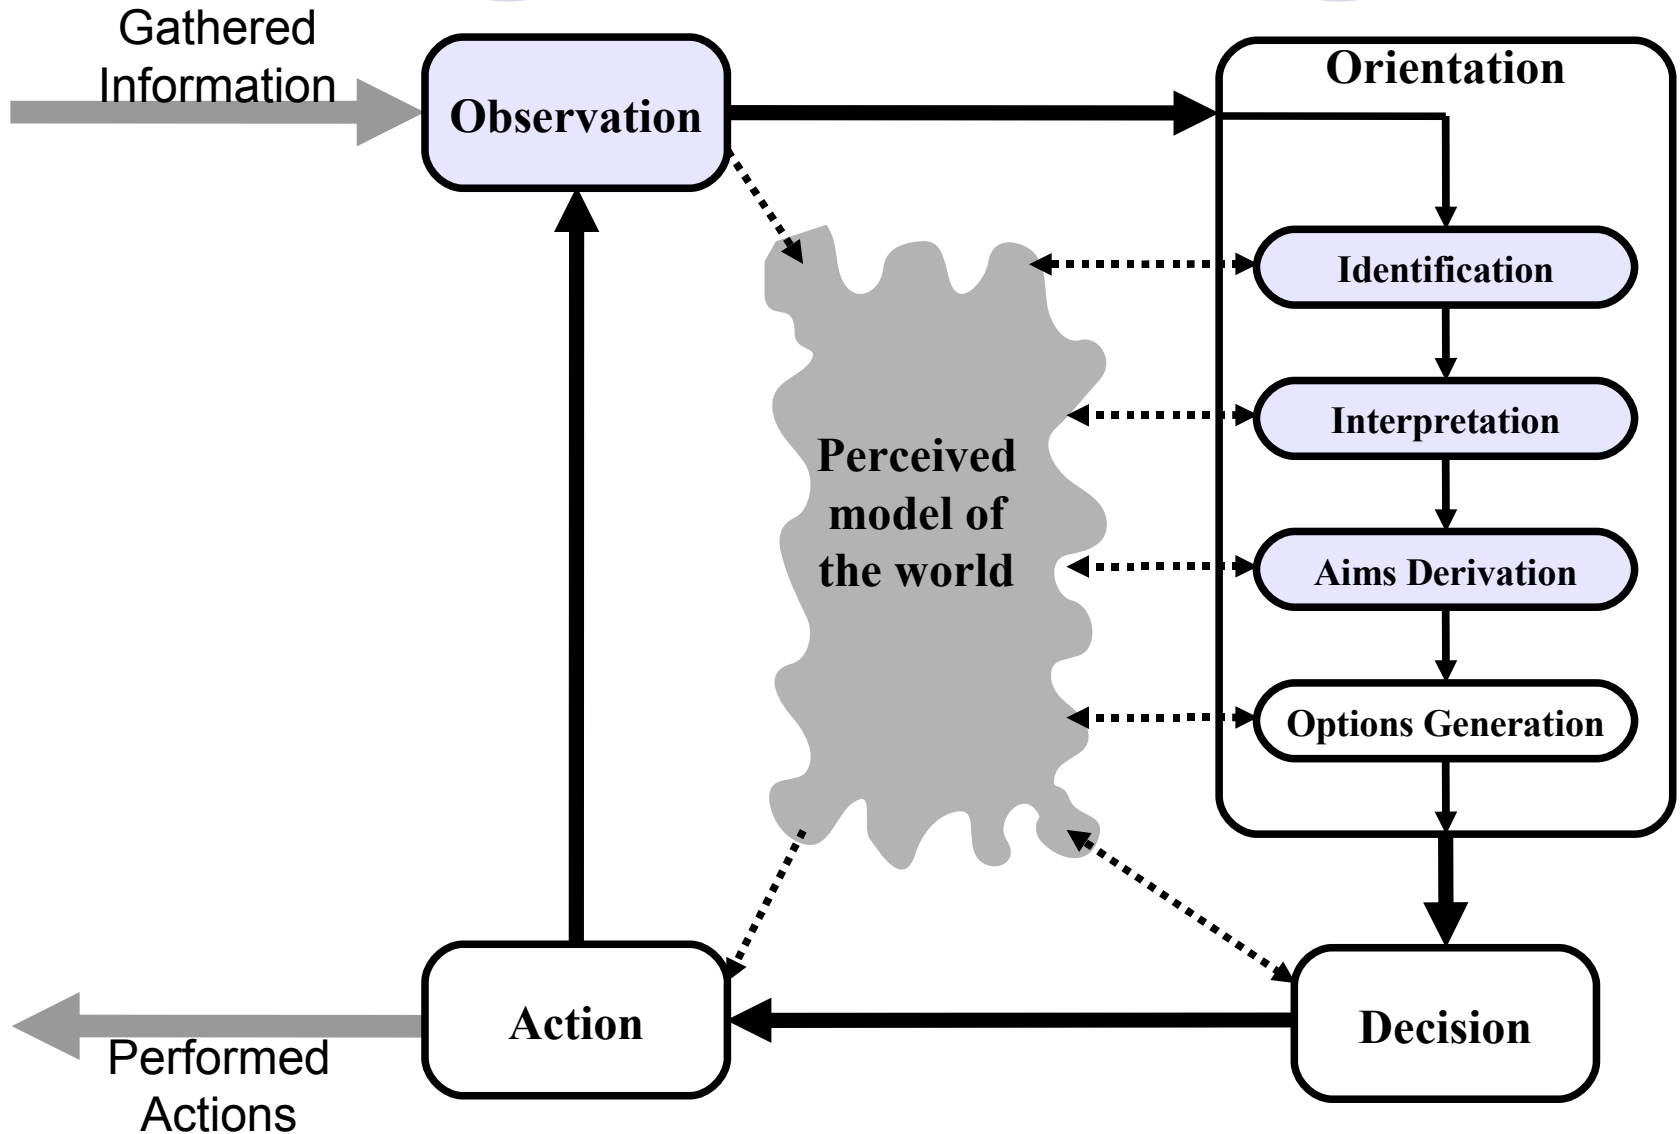

Expanded Orientation step

IW attacks that affect Orientation

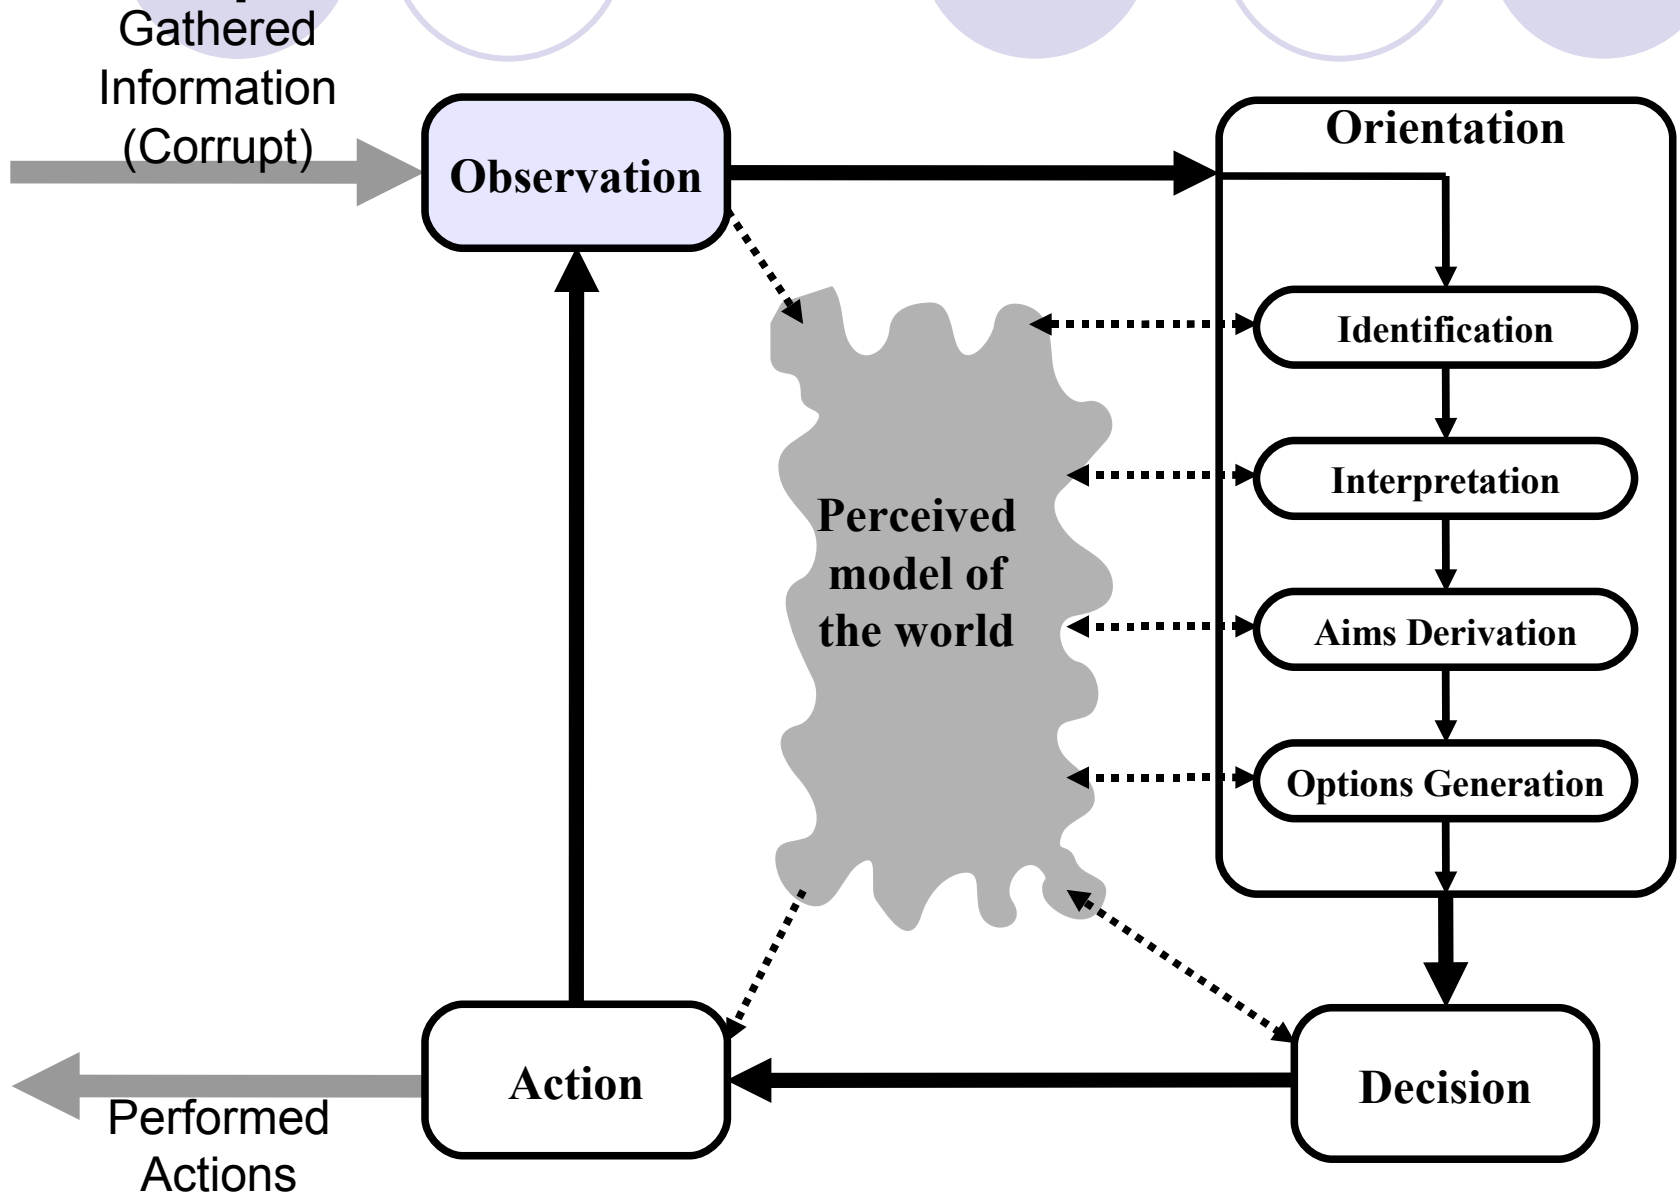

Deception

- Deception attacks provide false information that is accepted as true, before being used as input to decision-making

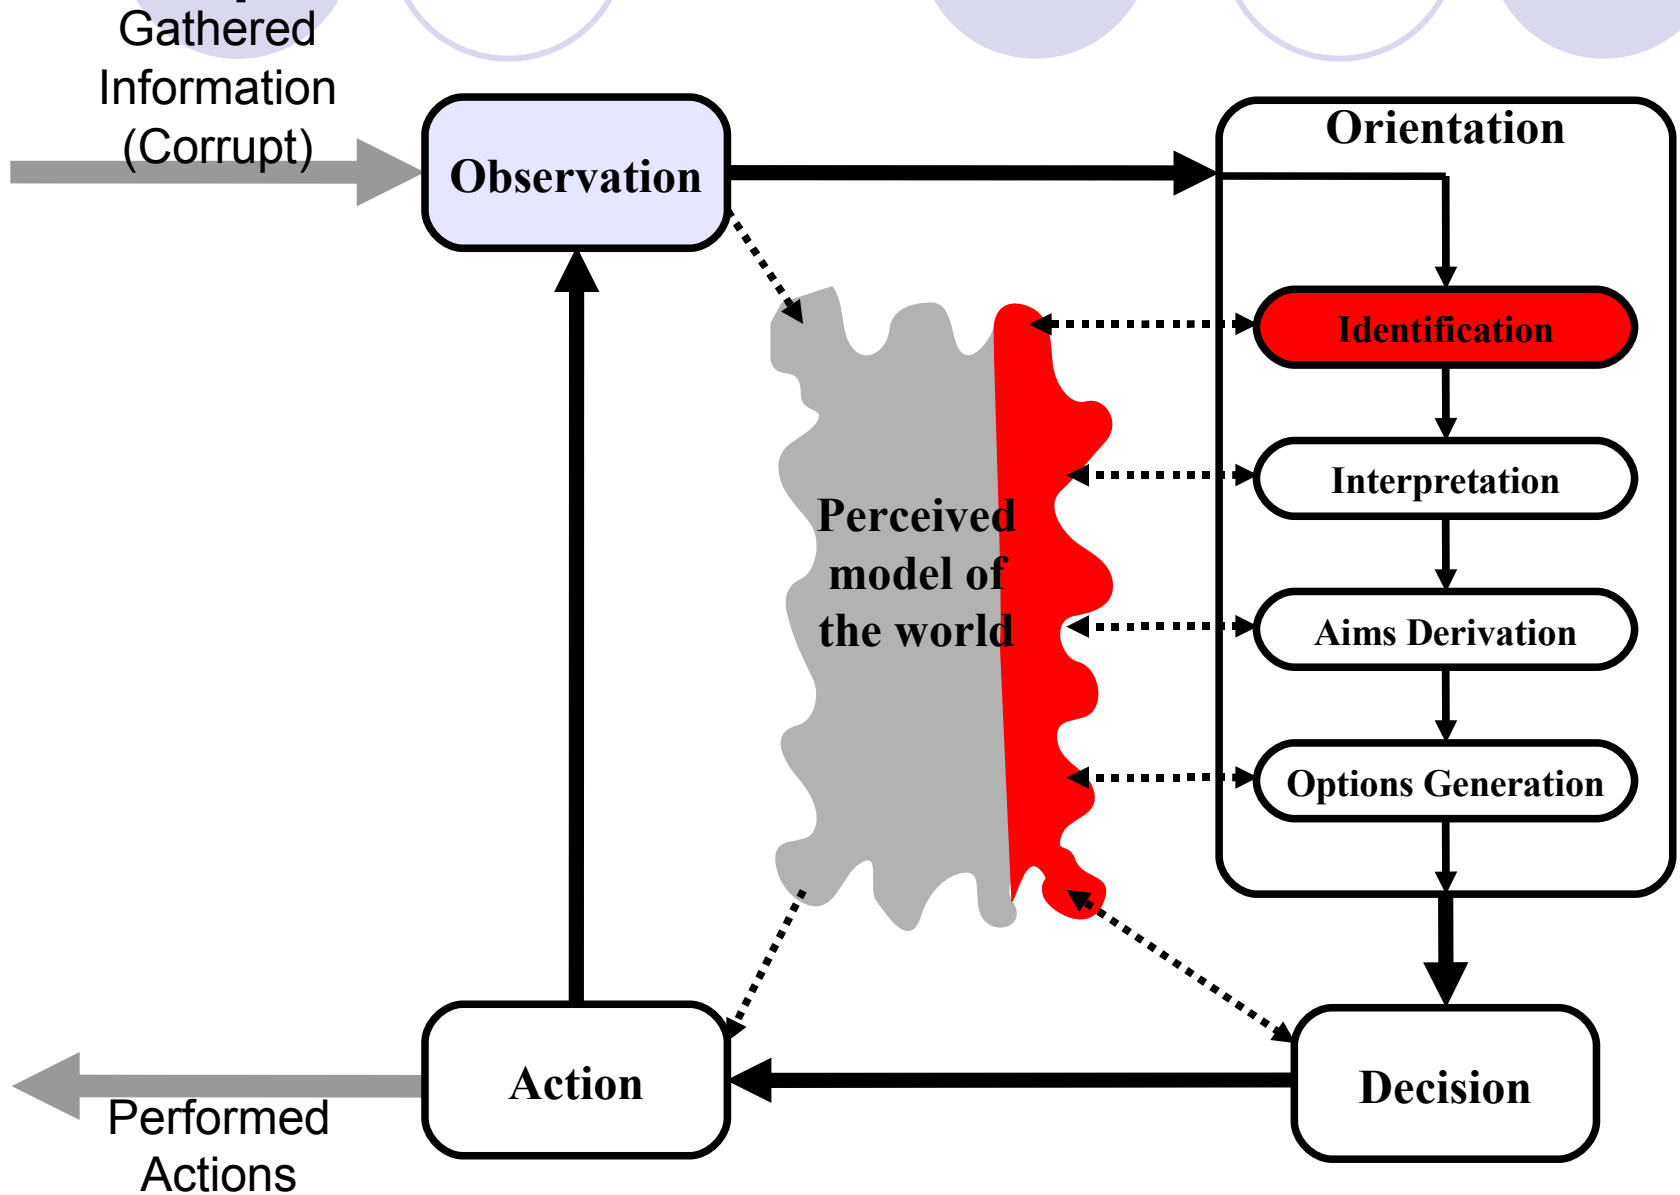

Self-deception

- Self-deception occurs when an individual believes something to be true, despite evidence that disproves it

Deception Attack

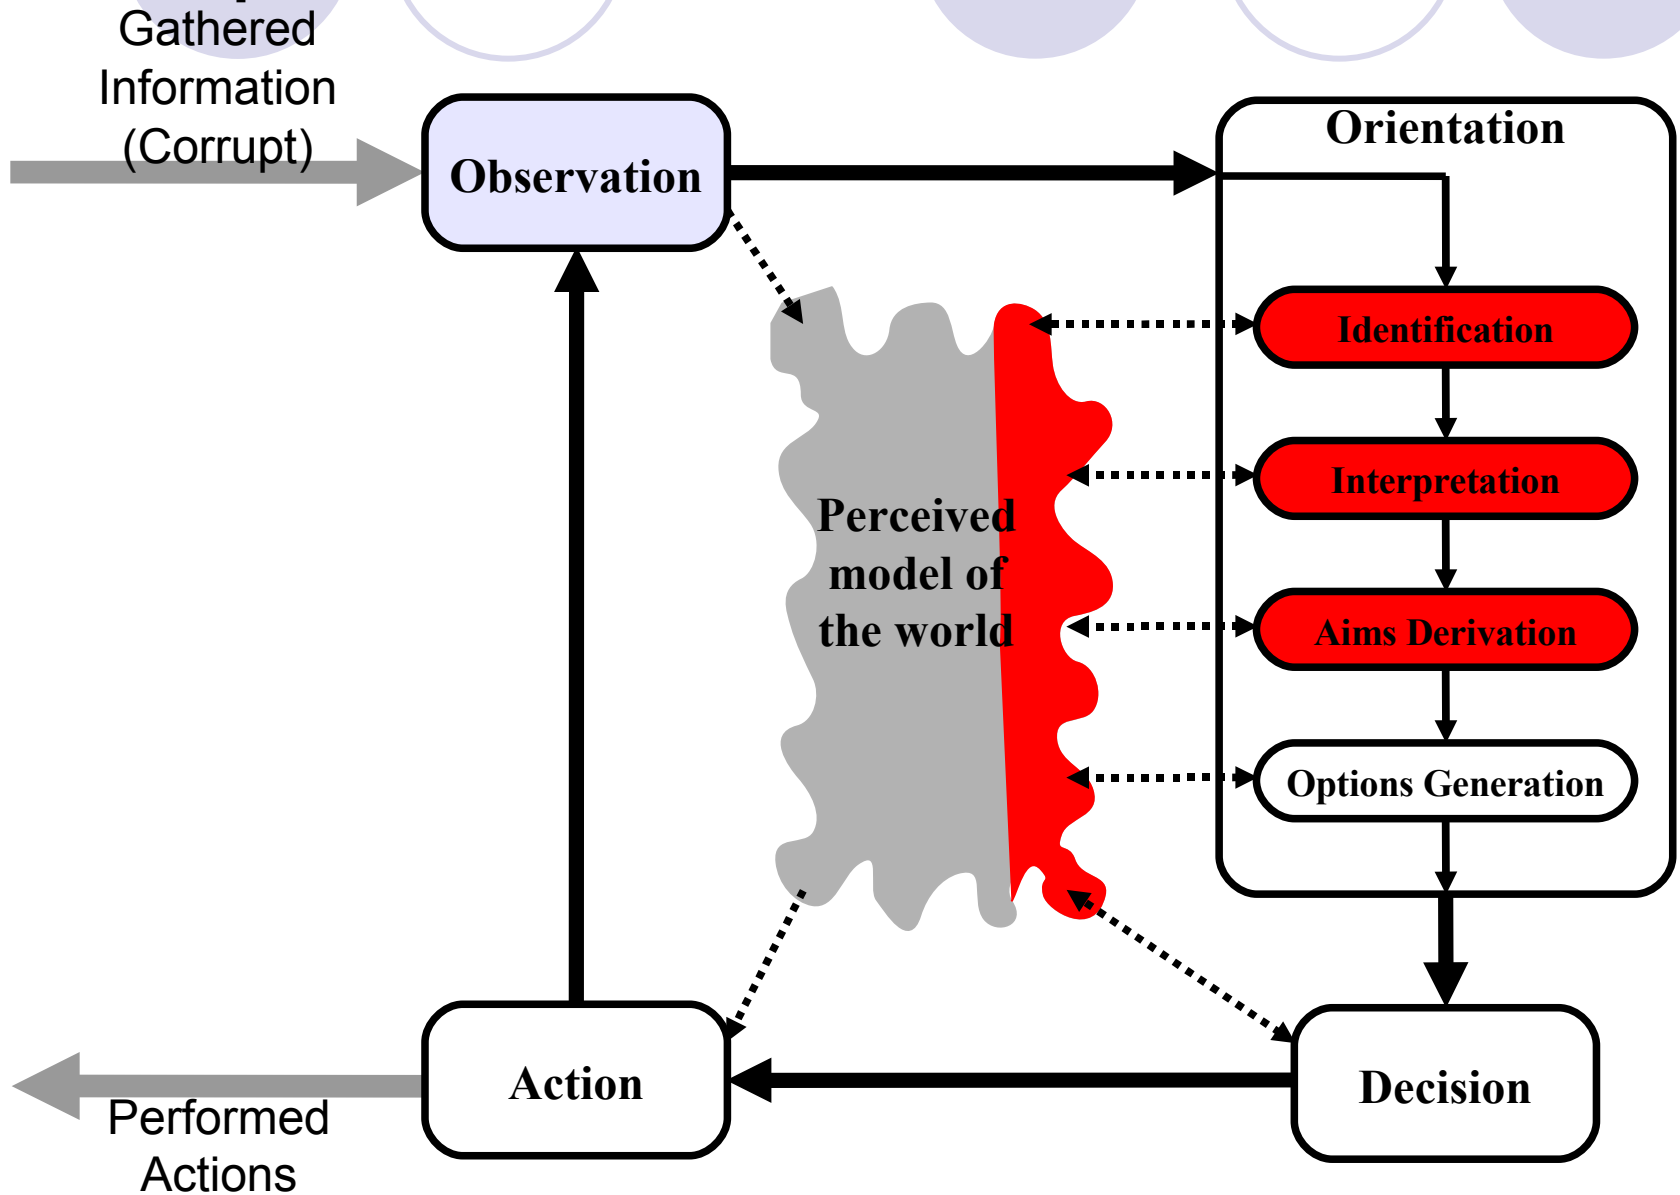

Deception Attack

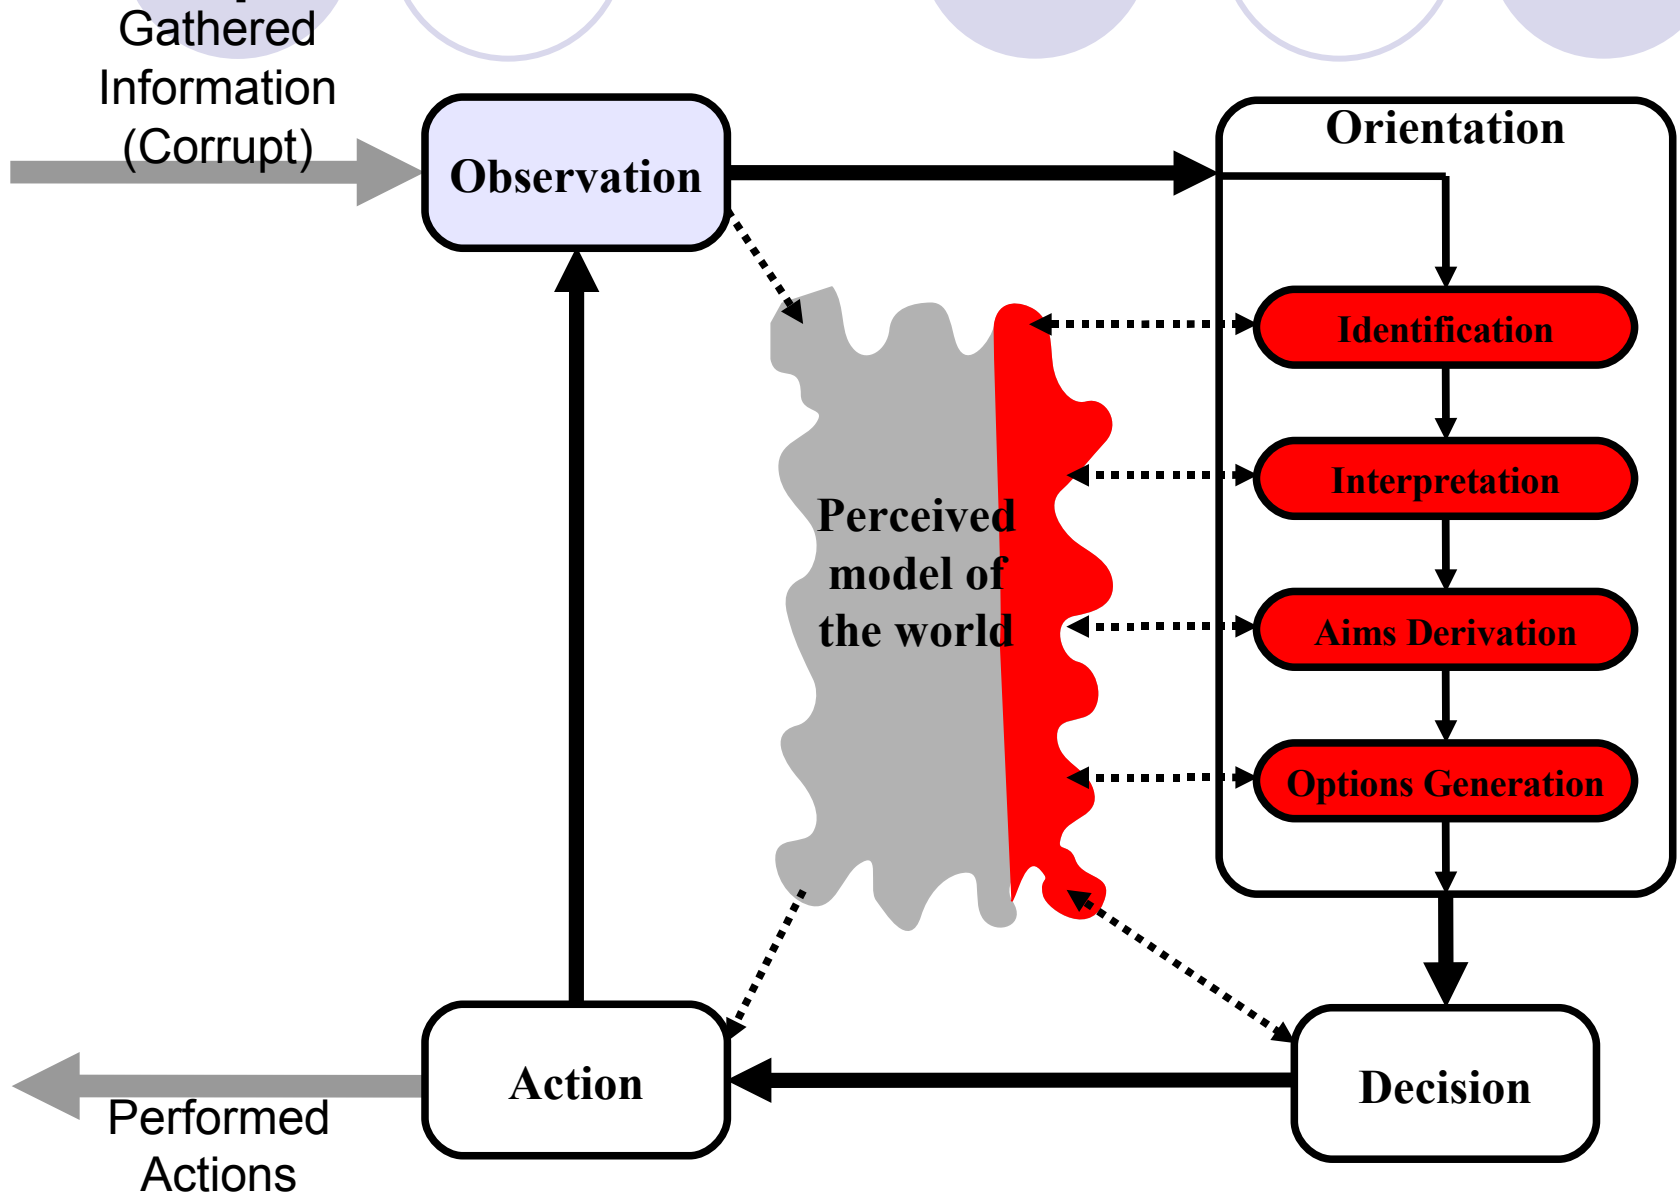

Deception Attack

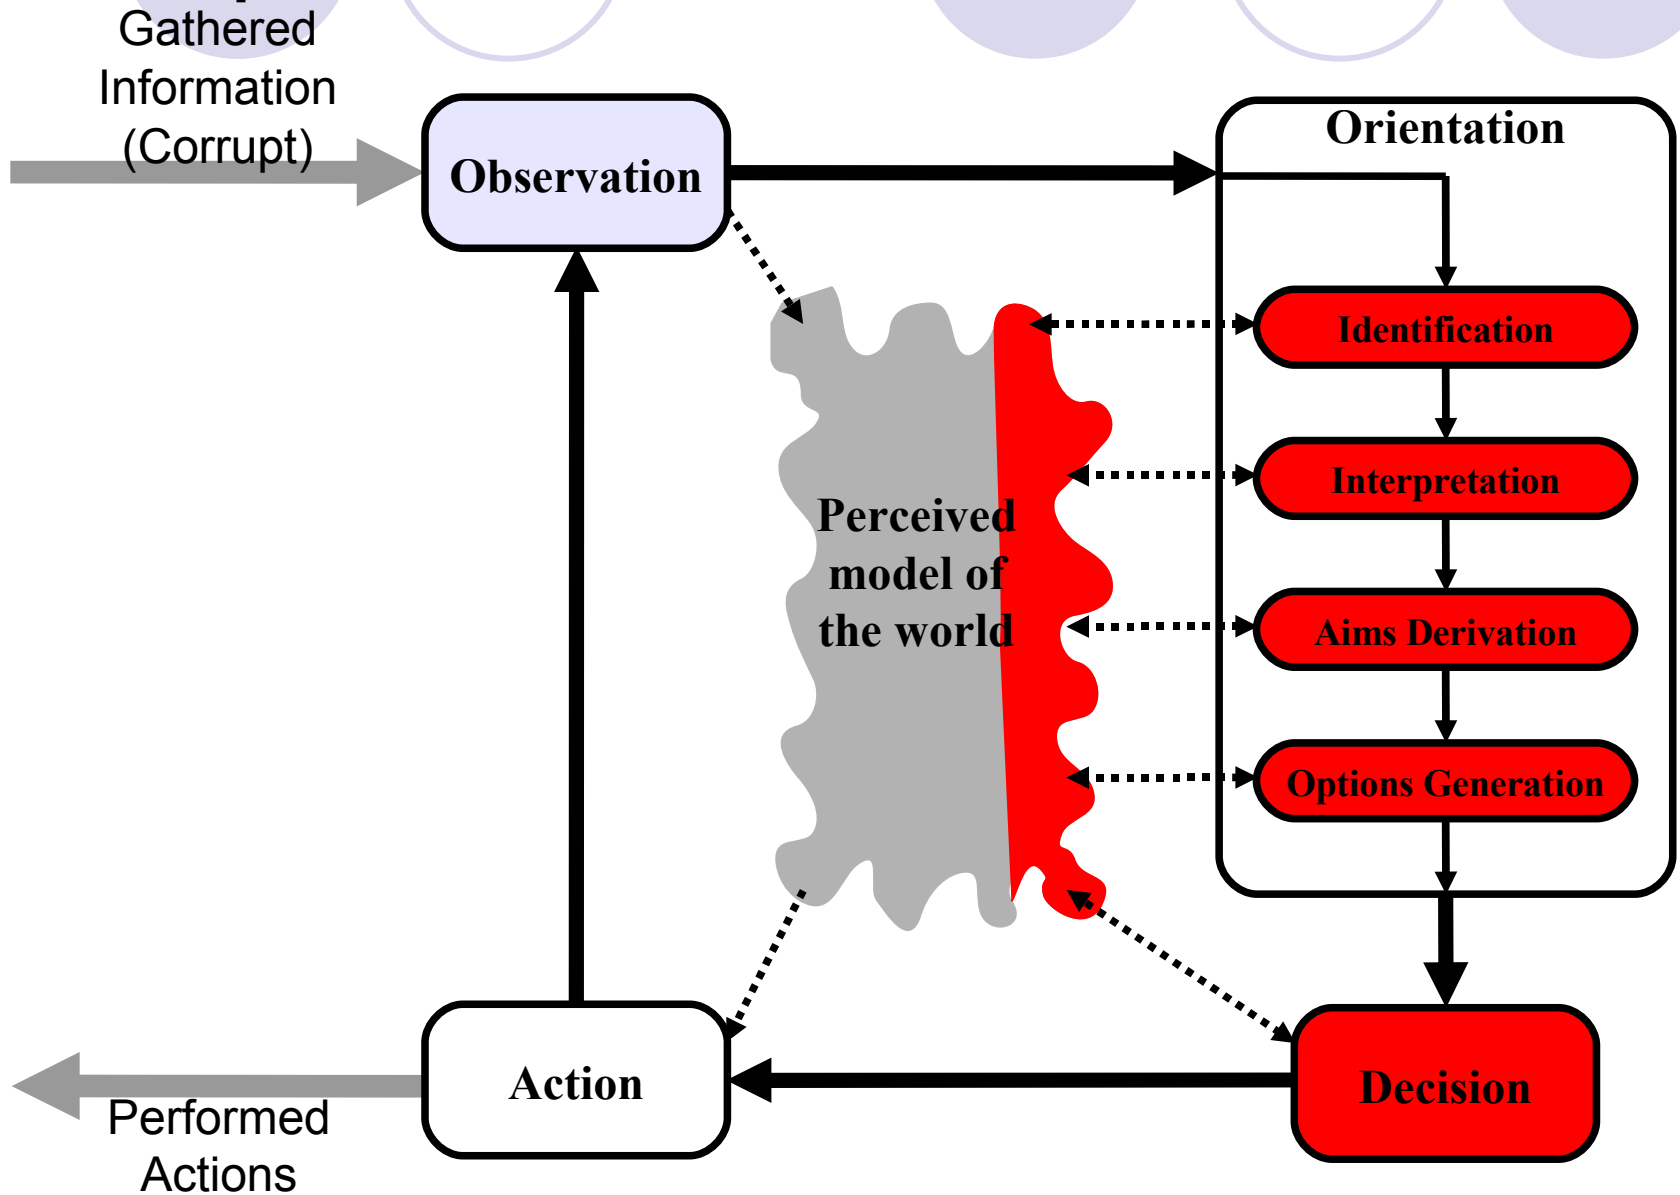

Deception Attack

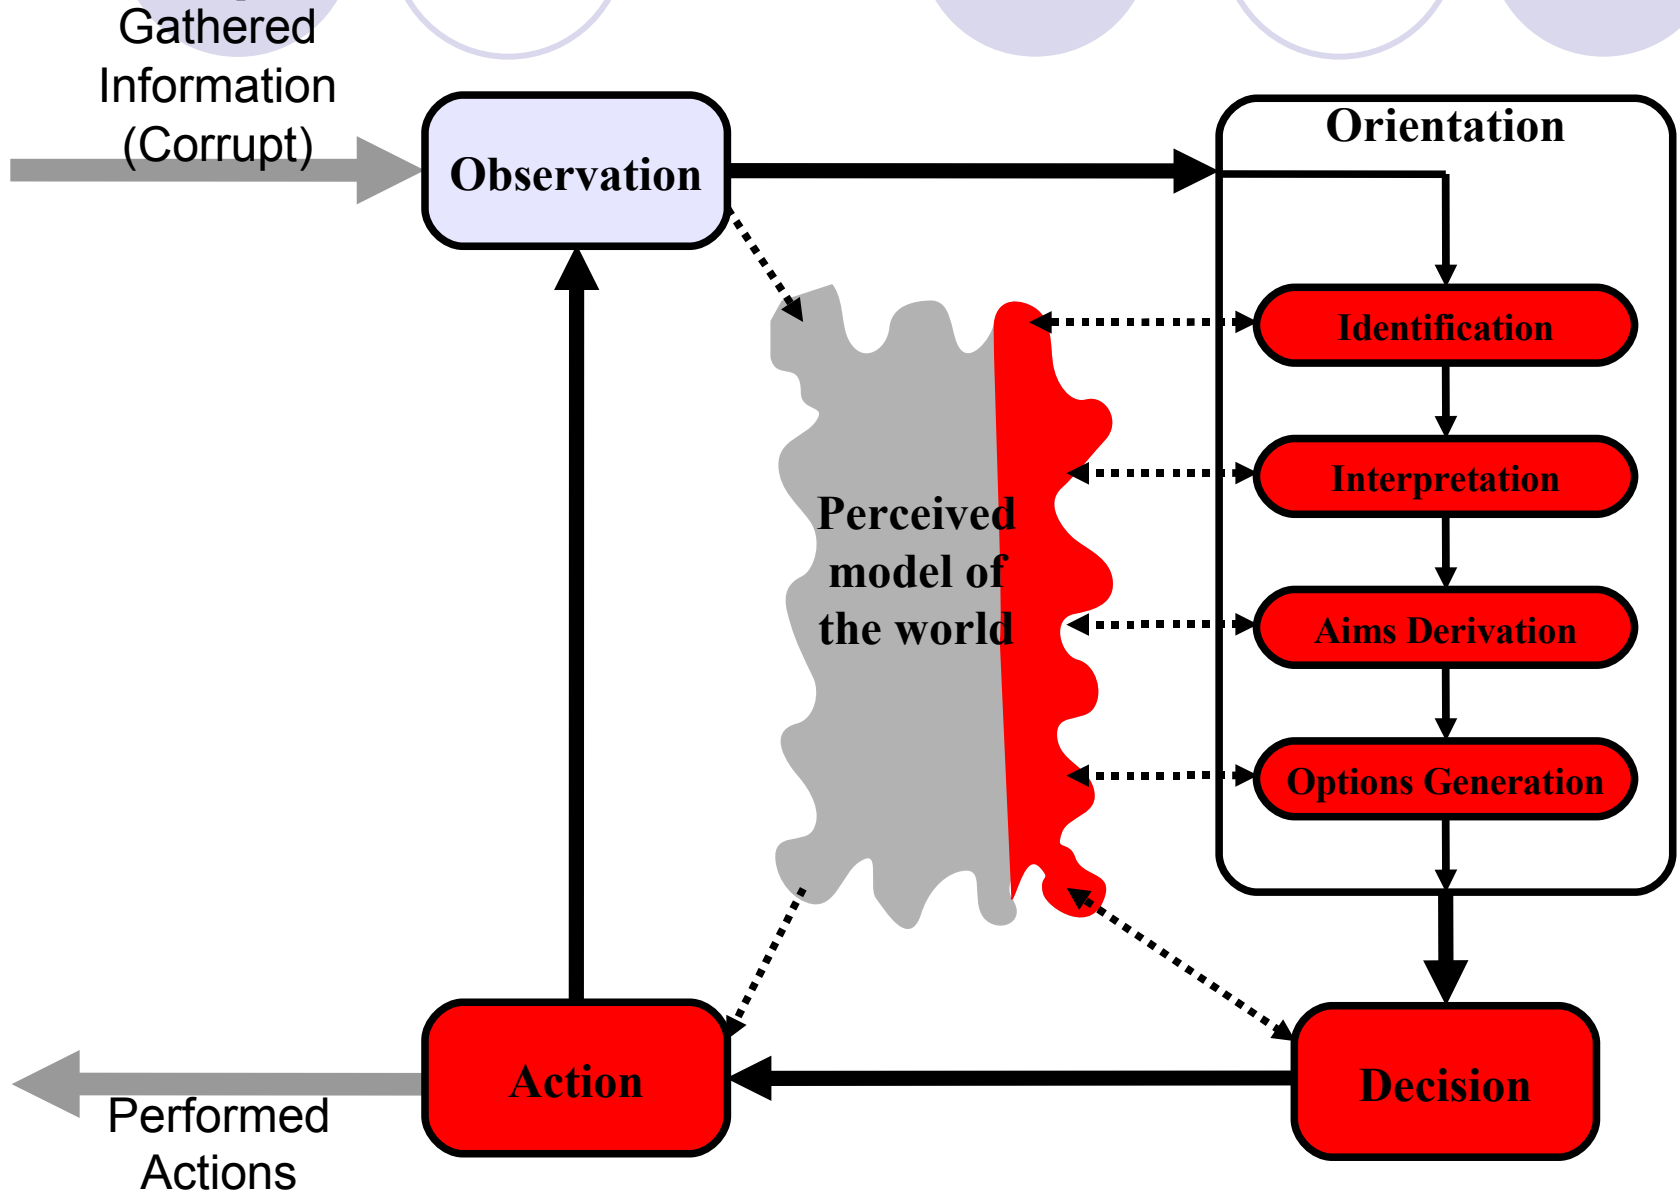

Deception Attack

Self-deception

- The word Self-deception suggests that it is a reflexive deception
- Self-deception is defined as an intentional misinterpretation in order to support a desired but unsupportable belief (Szabados 1974)

Case Studies

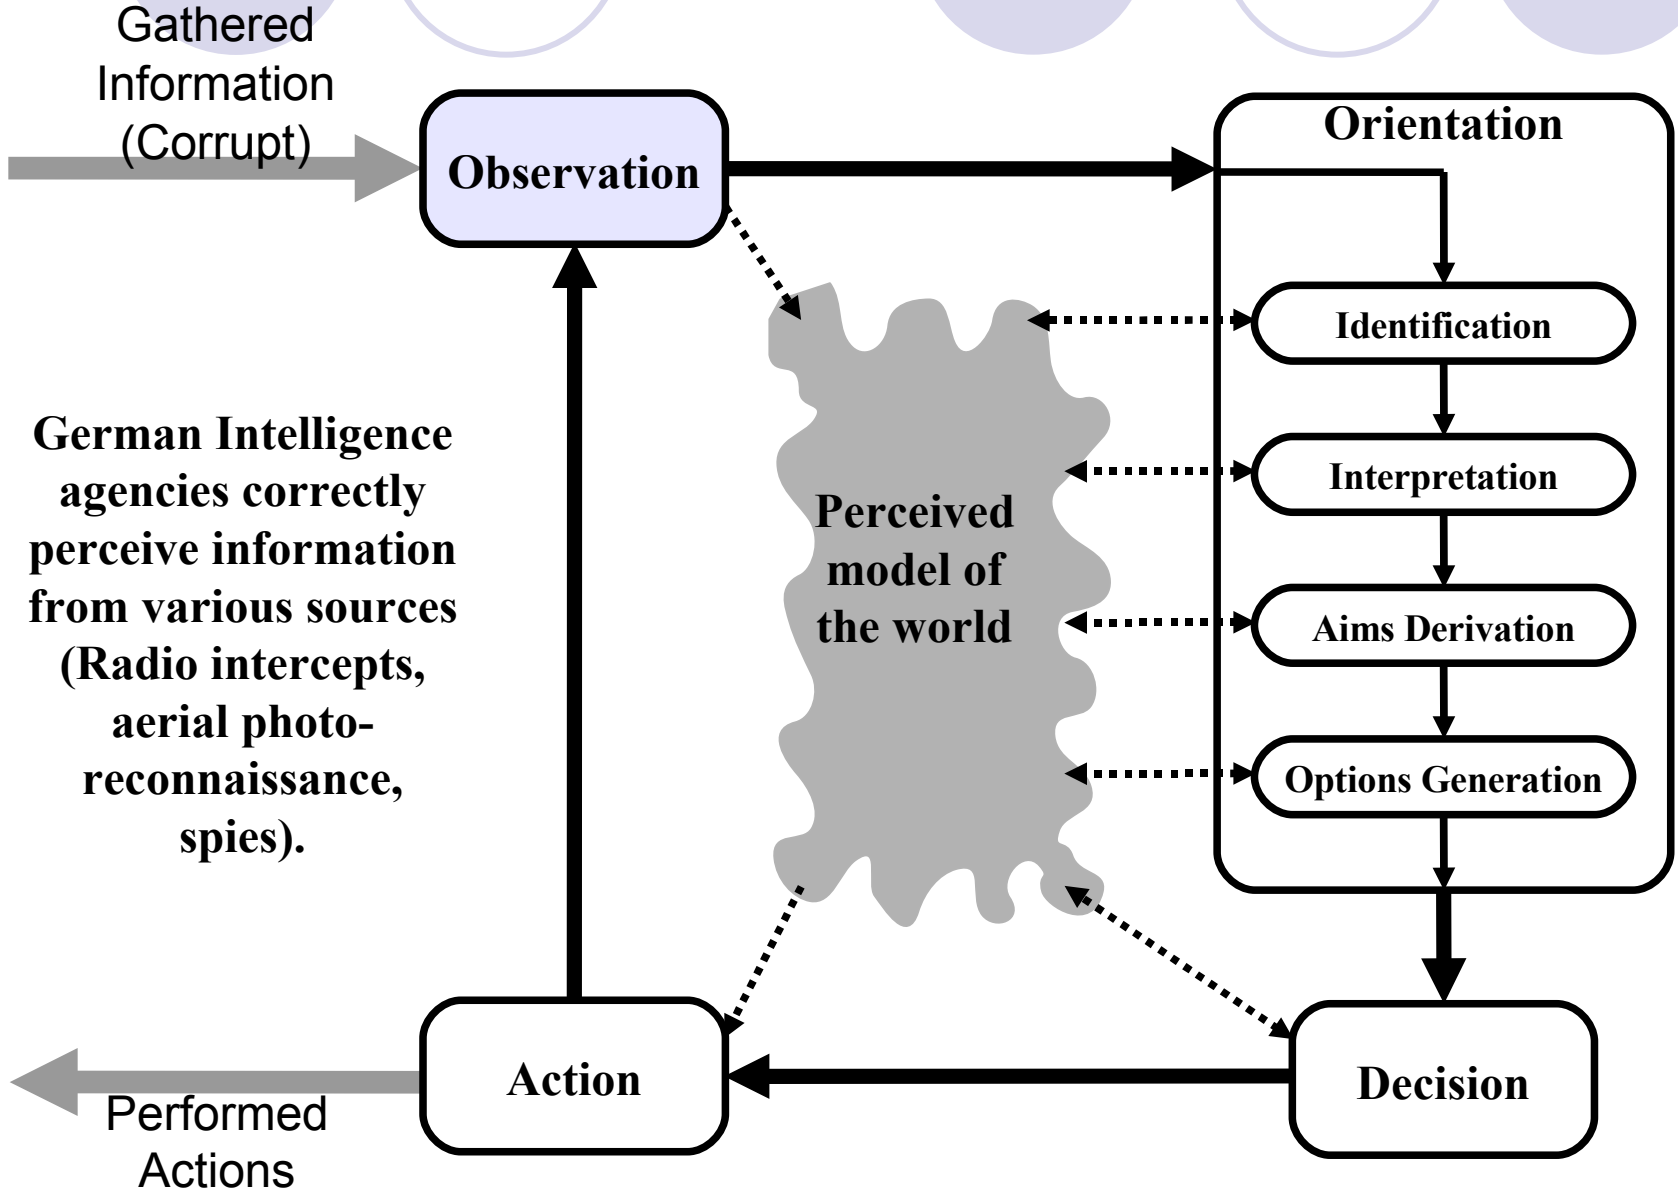

- Demonstrate where deception and self-deception cause errors in the Orientation step of the OODA loop
- Deception – Operation Fortitude
- Self-deception – Challenger Disaster

Operation Fortitude

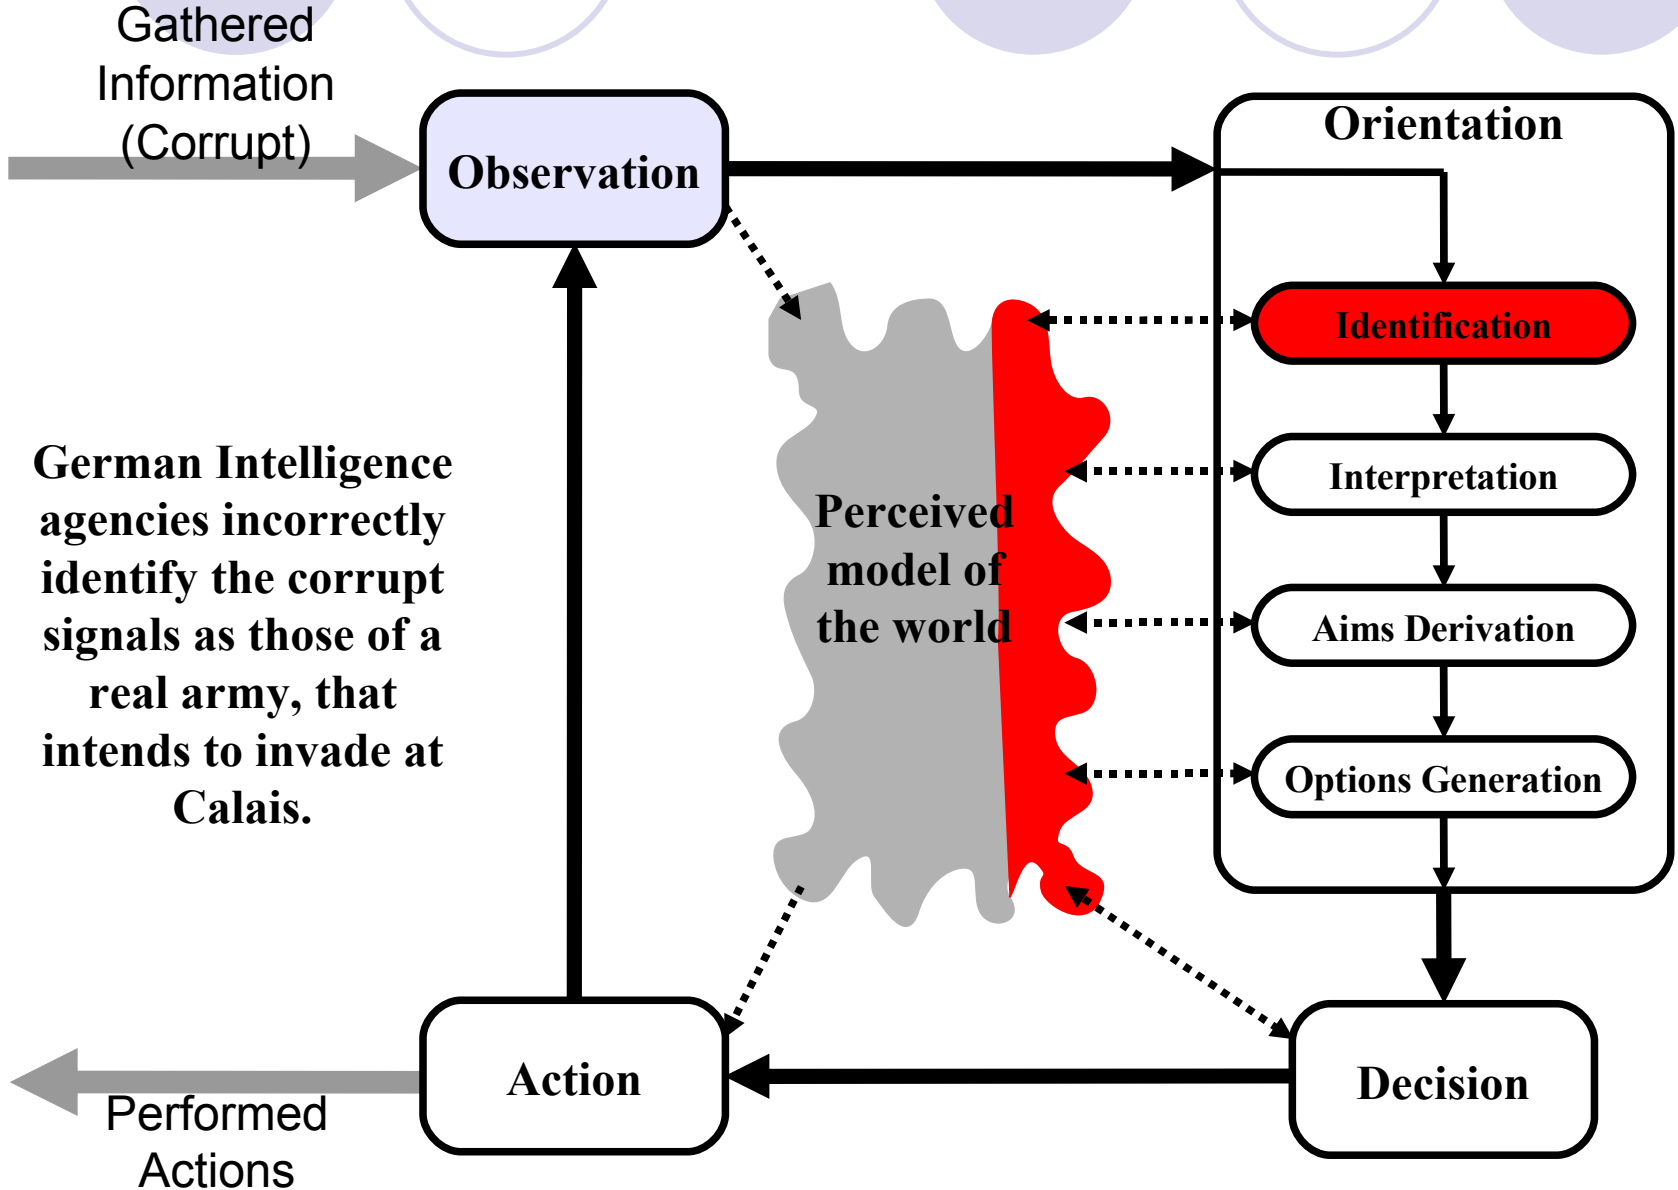

- Deception plan for the D-Day landings during World War II
- Deceived the Germans as to the target of the invasion and the time of the invasion

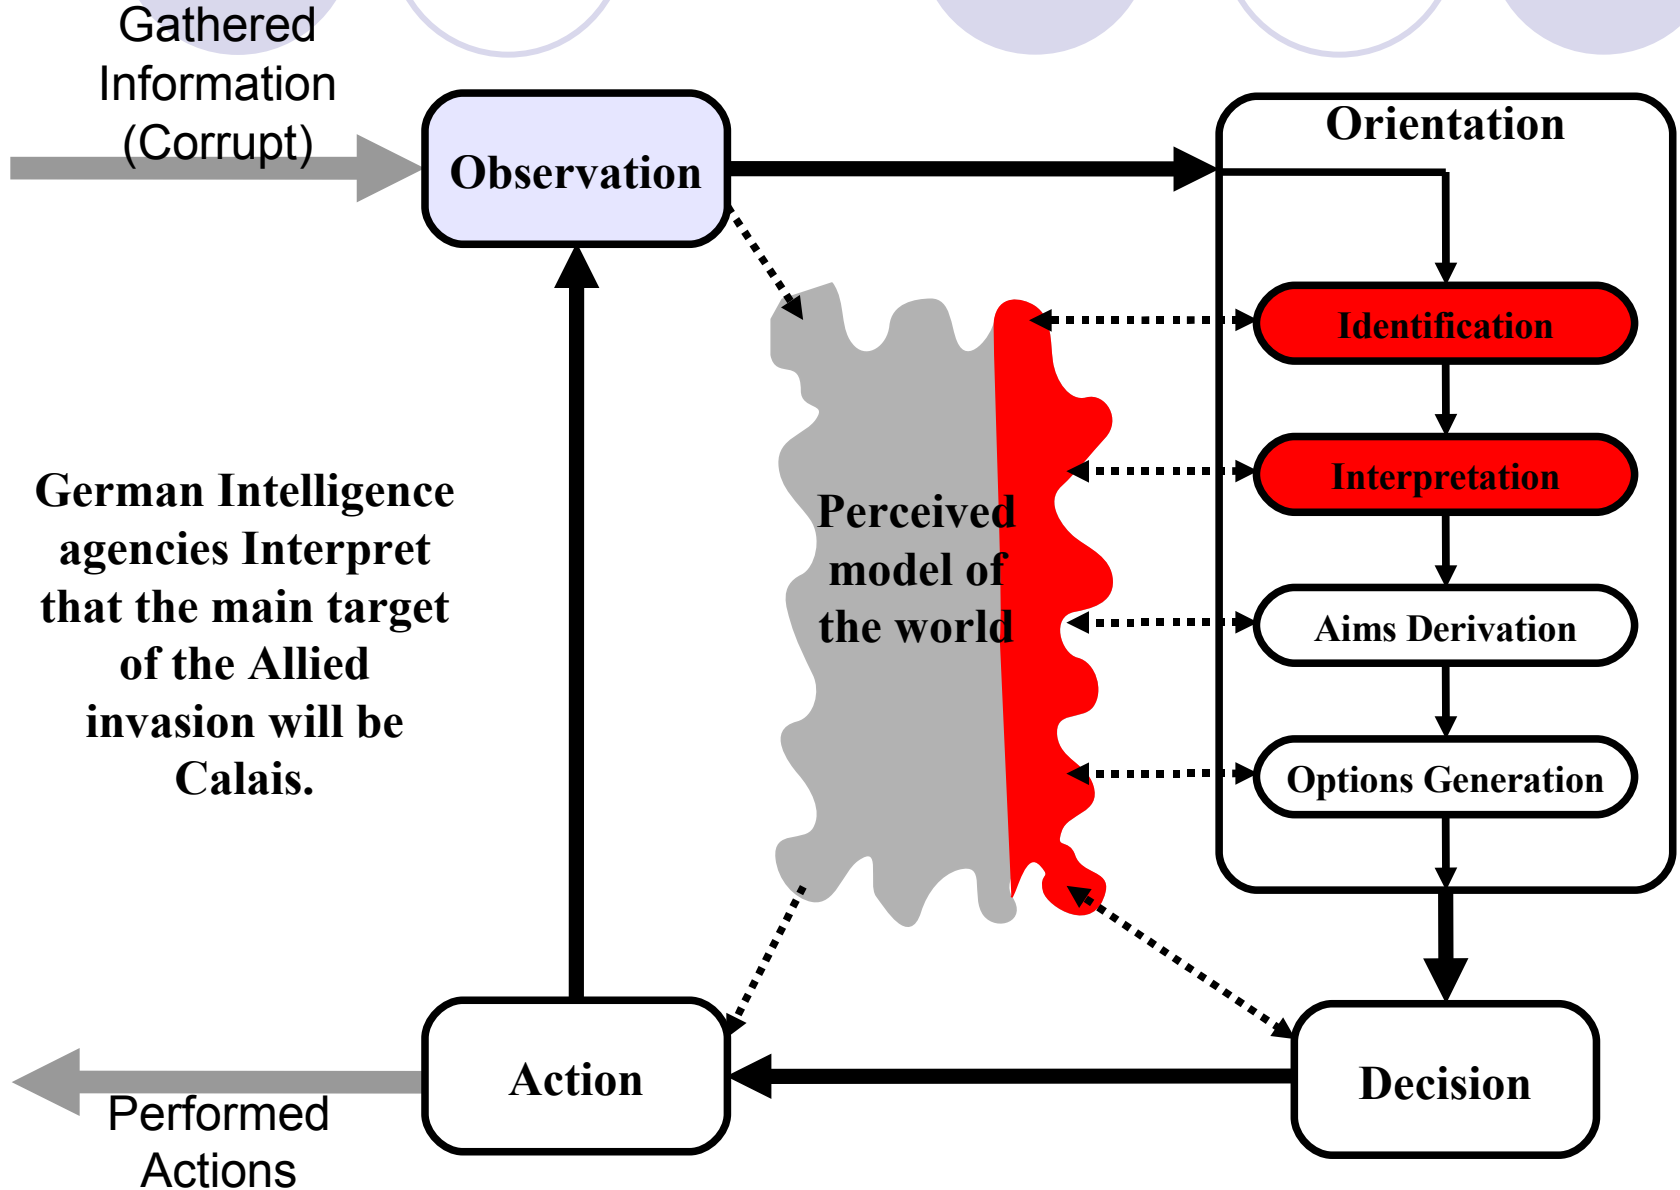

Operation Fortitude

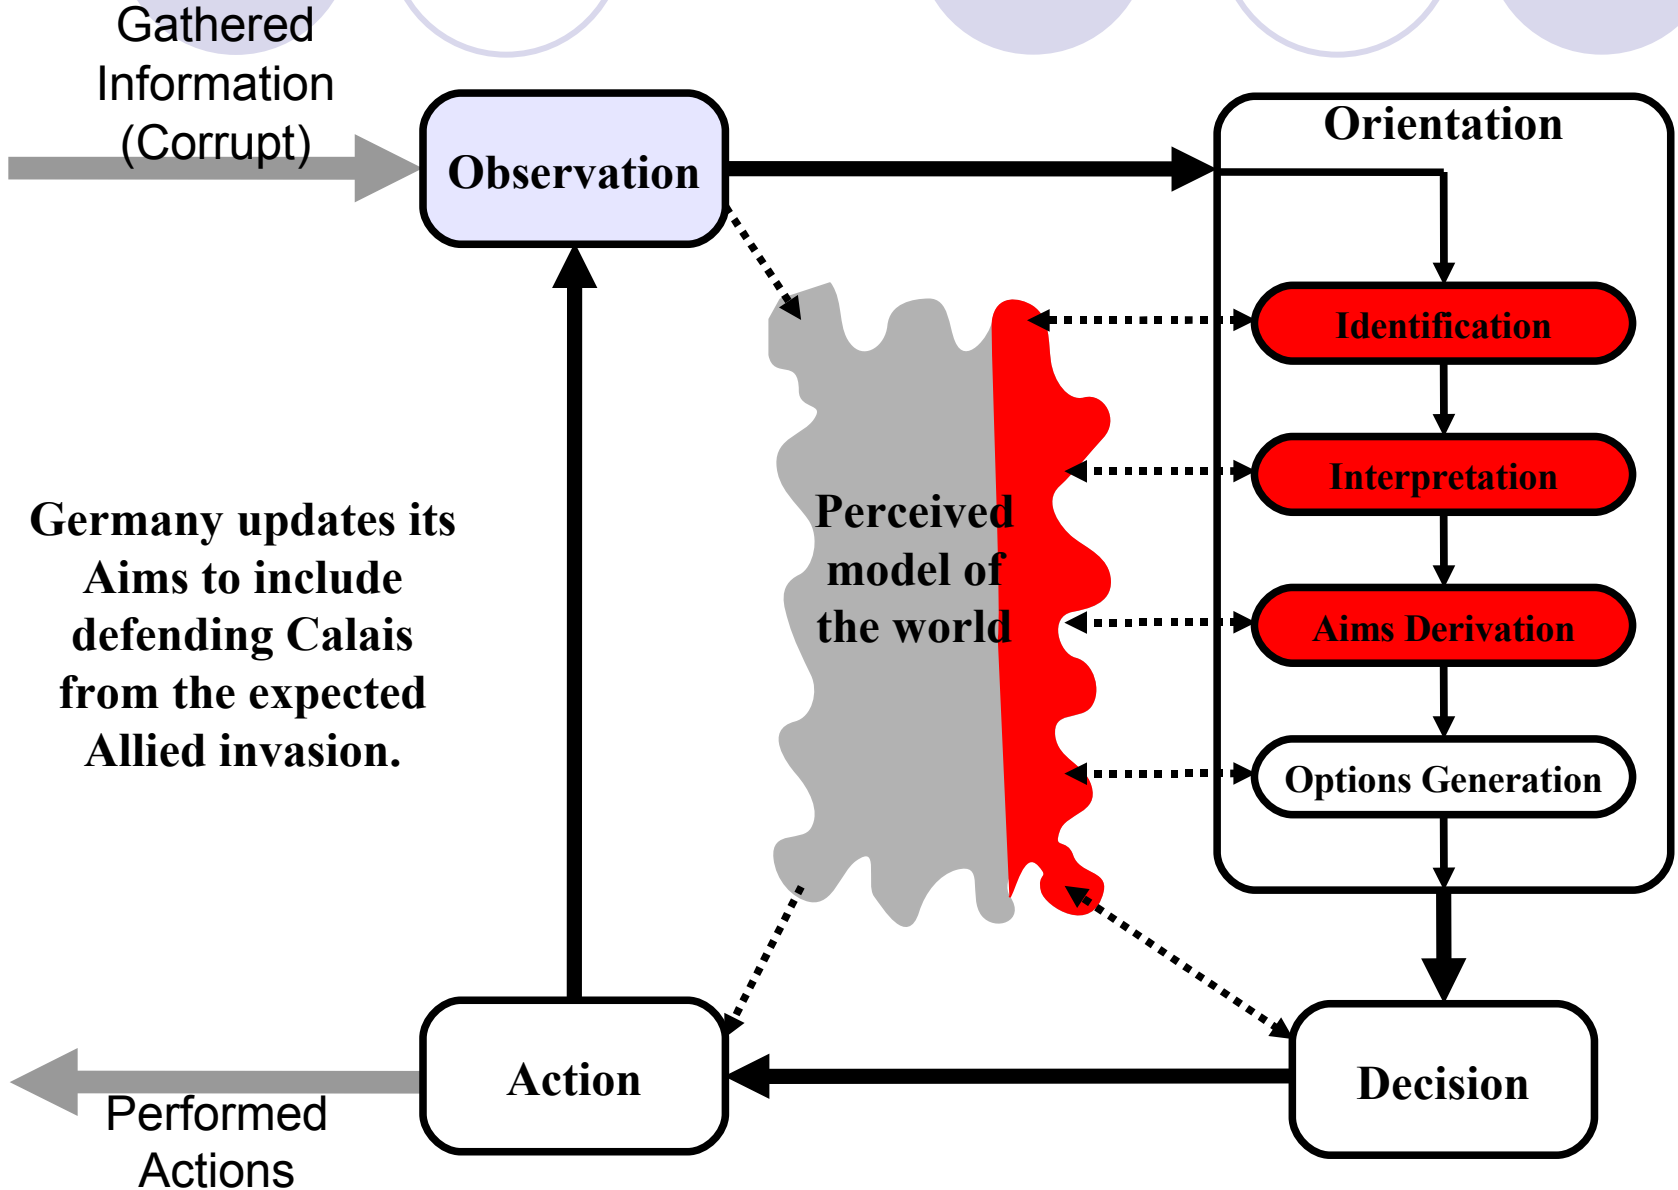

Operation Fortitude

Challenger Disaster

- The space shuttle Challenger disintegrated shortly after takeoff due to an O-ring failure, caused by the low temperature at the time of the launch
- The self-deception in this disaster was performed by Morton Thiokol management
- They were warned that the O-rings were damaged more during low temperature launches, however they misinterpreted the damage as proof of a safety factor

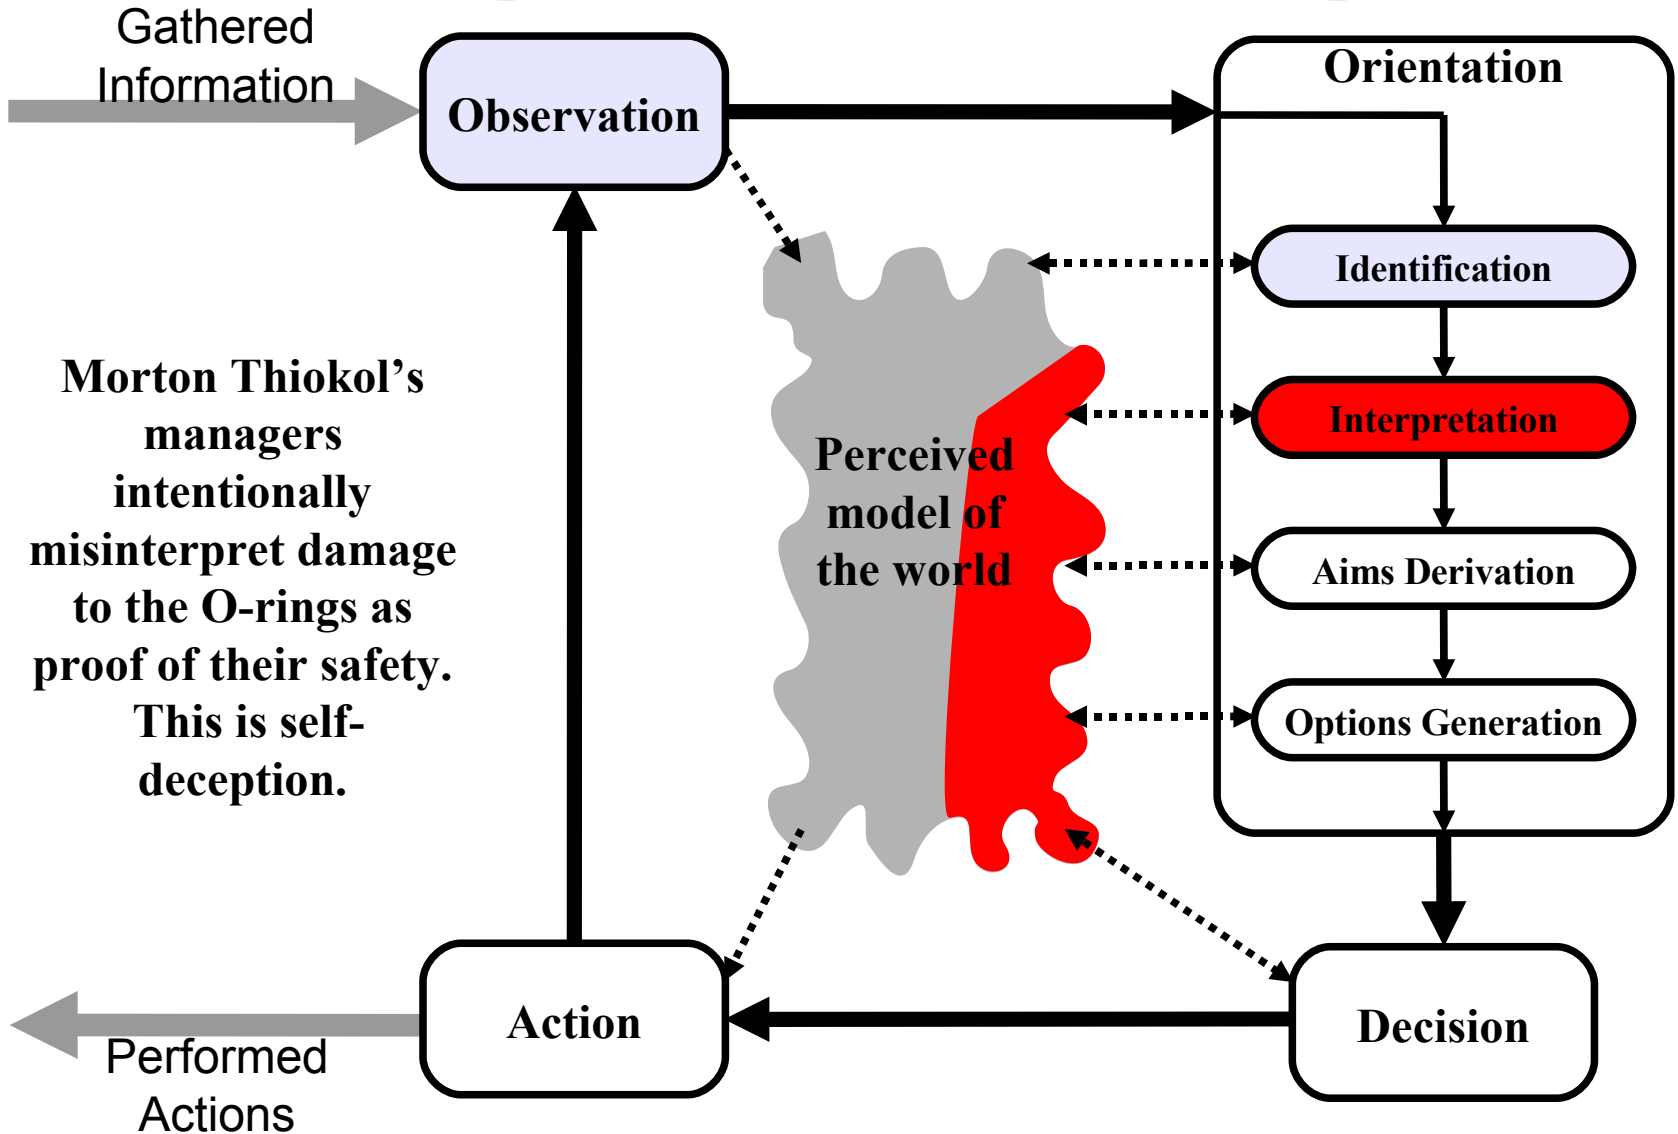

Challenger Disaster

Conclusion

- Orientation step details the updating of the decision-maker's model of the world and as such is a target for IW attacks
- Described a model of the internal processes of the Orientation step
